

# All-vanadium redox flow battery as shown

#### **Overview**

As the schematic shown in Fig. 1, a vanadium redox-flow battery has two chambers, a positive chamber and a negative chamber, separated by an ion-exchange membrane. These two chambers are circulated with electrolytes containing active species of vanadium in different valence states.

The same as other redox-flow batteries, vanadium redox-flow batteries have high energy efficiency, short response time, long cycle life, and independently tunable power rating and.

Since the vanadium redox-flow batteries invented by the M. Skyllas-Kazacos group at University of New South Wales in 1980s, more than 20 large-scale demonstrations have been built in different countries, including Australia, Thailand, Japan, USA, and.

Vanadium redox-flow battery is promising as an energy storage technology. I believe it would not take too long to overcome the limit and realize the commercialization of this technology. ©.

Aiming to eventually promote the vanadium redox-flow batteries to commercial application, studies are carried out on the following aspects: (1) robust ion-exchange membranes with high proton conductivity, good selectivity, and especially low cost;.
