

# Base station communication transmission process

### **Overview**

A BTS is usually composed of: Transceiver (TRX) Provides transmission and reception of signals. It also does sending and reception of signals to and from higher network entities (like the base station controller in mobile telephony). This can be separated into a dedicated device known as a Remote radio head (RRH). Power amplifier (PA) Amplifies the signal from TRX for transmission through antenna; may be in.

They handle signal transmission, encoding, and the handover process. These functions make sure we can communicate effectively using our mobile devices. At the heart of BTS operations is two-way signal handling. The station picks up signals from our devices and sends them to the network.
