

Canada s energy storage inverter standards

Overview

The UL 9540 certification is a relatively new safety standard in Canada, designed specifically for energy storage systems (ESS). This regulation adds an extra layer of protection, ensuring that batteries, inverters, and control systems within an ESS meet strict safety and performance requirements. What is the energy storage standard?

1.4 This Standard covers energy storage systems for stationary indoor and outdoor installations. This Standard also covers mobile energy storage systems as defined by this Standard. This Standard includes requirements for energy storage systems used in residential and non-residential installations.

Who is energy storage Canada?

Energy Storage Canada is the only national voice for energy storage in Canada today. We focus exclusively on energy storage and speak for the entire industry because we represent the full value chain range of energy storage opportunities in our own markets and internationally.

What are energy storage requirements?

1.1 These requirements cover an energy storage system (ESS) that is intended to receive and store energy in some form so that the ESS can provide electrical energy to loads or to the local/area electric power system (EPS) when needed. Electrochemical, chemical, mechanical, and thermal ESS are covered by this Standard.

What are Canadian grid-connected solar PV systems?

Most Canadian grid-connected solar PV systems are designed with the modest goal of reducing grid electricity use to some extent. Some projects have the more ambitious goal of achieving Net-Zero Energy (NZ) or Net-Zero Electricity performance using grid-connected solar PV.

Can a bi-modal inverter power a building?

Bringing DC power into the building is undesirable. A bi-modal inverter can operate grid-connected, or stand-alone (off-grid) in the absence of grid supply; using solar PV and battery storage to provide backup power during grid outages. As with other grid-connected inverters, surplus solar energy flows out to the grid during normal operation.

Can a bi-modal inverter be used in a grid-connected system?

In grid-connected systems with battery storage, use of bi-modal inverters can provide back-up electricity to essential loads during grid outages. All off-grid houses will require battery storage Inverters-chargers must be capable of operating without grid supply.
