

Do lithium battery packs need voltage division

Overview

How much voltage does a Li-ion battery pack have?

In Li-ion batteries, the voltage per cell usually ranges from 3.6V to 3.7V. By connecting cells in series, you can increase the overall voltage of the battery pack to meet specific needs. For example, a battery pack with four cells in series would have a nominal voltage of around 14.8V.

Why is a lithium battery pack designed with multiple cells in series?

Contributed Commentary by Anton Beck, Battery Product Manager, Epec When a lithium battery pack is designed using multiple cells in series, it is very important to design the electronic features to continually balance the cell voltages. This is not only for the performance of the battery pack, but also for optimal life cycles.

Do lithium-ion batteries need a battery pack?

To meet practical usage requirements, lithium-ion batteries usually need to form a battery pack. However, due to production deviations and different usage environments, there are inconsistencies between batteries within the battery pack. This makes it challenging to estimate the state of charge (SOC) of the battery pack accurately.

What should you know about lithium ion batteries?

The most important key parameter you should know in lithium-ion batteries is the nominal voltage. The standard operating voltage of the lithium-ion battery system is called the nominal voltage. For lithium-ion batteries, the nominal voltage is approximately 3.7-volt per cell which is the average voltage during the discharge cycle.

How to achieve energy balance between lithium-ion batteries?

In this paper, the single capacitor method is employed to achieve the energy balance between lithium-ion batteries. By controlling the on-off of the switch,

the single battery with higher voltage in the battery pack is charged to the capacitor C, and then the capacitor C charges the battery with lower voltage.

What are the characteristics of a battery pack?

Voltage and capacity Voltage and capacity are fundamental characteristics of any battery pack. In Li-ion batteries, the voltage per cell usually ranges from 3.6V to 3.7V. By connecting cells in series, you can increase the overall voltage of the battery pack to meet specific needs.
