

Factors that determine photovoltaic module prices

Overview

The cost of a solar photovoltaic panel module typically ranges from 0.50 to 1.00 USD per watt (1), with the average price being around 0.75 USD per watt; various factors influence this price (2), including efficiency, brand reputation, and technology type; bulk purchases often lead to significant discounts (3), making it financially advantageous for larger installations; installation costs are additional and can vary widely, typically constituting 20 to 50 percent of the total system cost (4). What factors affect the cost of photovoltaic modules?

1. Cost Factors Driving Price Fluctuations The cost of photovoltaic modules is primarily composed of solar cells, glass, encapsulation film, and labor expenses.

Will price fluctuations affect the photovoltaic module market?

As the global energy transition accelerates, the photovoltaic (PV) industry, as a key component of renewable energy, continues to attract significant attention for its promising development prospects. However, price fluctuations in the photovoltaic module market remain a critical factor influencing the industry's growth.

Why do solar modules cost so much?

However, as the primary cost component of photovoltaic modules, the price of solar cells plays a decisive role in module pricing. Due to the oversupply of polysilicon in earlier periods, prices have been under sustained pressure since 2023, even falling below cost levels in the first half of 2024.

How are photovoltaic module price adjustments affecting industry players?

The current round of photovoltaic module price adjustments has imposed significant operational pressure on industry players. Leading companies, with their high R&D costs, are at a disadvantage in the price competition. Meanwhile, small and medium-sized enterprises find it challenging to endure prolonged price wars.

How does polysilicon affect the price of solar panels?

Polysilicon, a high-purity form of silicon, is a key raw material – forming solar cells and solar modules – in the solar photovoltaic (PV) supply chain. Hence, any change in the prices of polysilicon would affect the price of solar modules which will lead to an increase in the overall cost of solar power.

How does overcapacity affect the price of photovoltaic modules?

In an environment of overcapacity, the selling price of photovoltaic modules gradually approaches cost, with some companies even selling below cost to reduce inventory, further driving downward pressure on prices.
