

German energy storage power station operation

Overview

Why should Germany use energy storage systems?

Germany is under increasing pressure to rapidly decarbonize its electricity system, while ensuring a secure and affordable electricity supply. In this context, energy storage systems (ESSs) can play a crucial role in enabling a high share of variable renewable electricity generation.

How can traditional power plant sites contribute to German and European energy supply?

With this storage facility, traditional power plant sites can make an exemplary contribute to the German and European energy supply. Please click on the image to zoom At the sites of the power plants in Hamm and Neurath, an intelligent, net-worked storage system is being built.

What is the business model for a German energy storage system?

Therefore the business model for a German energy storage system is slightly different to business models in other markets. The key business models in Germany comprise: Improvement of reliability of electricity supply for industrial production.

Can pumped hydro storage be a key component of Germany's electricity system?

The study by Keles and Yilmaz, for instance, considers only the option of pumped hydro storage (PHS), as it is already a key component of the German electricity system. Others consider multiple technology options, with Bartholdsen et al., for instance, considering also lithium-ion batteries and hydrogen storage (via power-to-gas).

How does Germany support the energy transition?

The German population supports the goals of the energy transition. Improved energy self-sufficiency in private households and commercial operations

enjoys widespread acceptance. More than 1.7 million solar power plants, with a total capacity of more than 45 GWp, have been installed in Germany over the past 25 years.

How is Germany transforming the energy system?

In addition to the complexity of transforming the German electricity system, climate-related targets and policies have been tightened substantially. The newest amendment of the Renewable Energy Sources law requires renewable energy sources to cover at least 80% of the annual electricity consumption in 2030.
