

# How big a photovoltaic panel is needed for household electricity

#### **Overview**

While it varies from home to home, US households typically need between 10 and 20 solar panels to fully offset how much electricity they use throughout the year. The goal of most solar projects is to offset your electric bill 100%, so your solar system is sized to fit your average electricity use. How many solar panels do you need to power a house?

The goal for any solar project should be 100% electricity offset and maximum savings — not necessarily to cram as many panels on a roof as possible. So, the number of panels you need to power a house varies based on three main factors: In this article, we'll show you how to manually calculate how many panels you'll need to power your home.

How big should a solar panel be?

The table above assumes solar panel dimensions of 5.5 feet by 3 feet. If your home is small or has an unusually shaped roof, the power output and efficiency of your solar panels are especially important to consider. With a large roof, you can probably choose less efficient solar panels because you have more space for more panels.

How many solar panels are needed for a 10 kW solar system?

A1 SolarStore calculator has already proposed 32 panels 325 W each for the 10.24 kW medium size solar PV system. The formula is very simple: There is one variable in the formula above – solar panel output. It means that you can design a system consisting of 26 panels 390 W each, for example.

How much does a home solar panel cost?

While powering your home on solar energy can save you money, it does require a serious investment upfront. The costs to power your home on solar and your budget will determine how many solar panels you can afford. Currently, the average cost for a home solar panel system is around \$3 to \$4 per watt, according to various industry surveys.

How much energy do you need to install solar panels?

Energy production required = 49.3 kWh per day / 5 hours, which equals 9.86 kW. Step 4. Calculate the number of panels: Lastly, you'll need to determine the wattage of the solar panels you plan to install. The average solar panel efficiency in the US is rated between 250 and 400 watts.

Is a 10 kW Solar System enough to power a house?

Yes, in many cases a 10 kW solar system is more than enough to power a house. The average US household uses around 30 kWh of electricity per day, which can be offset by a 5 to 8.5 kW solar system (depending on sun exposure). See how much solar panels cost in your area. Zero Upfront Cost.
