

# How long does the base station energy storage battery need to last

#### **Overview**

The average lifespan of a battery storage system ranges between 5 and 30 years, depending on the battery technology. One of the most critical factors is the number of charge cycles—the number of times a battery is fully charged and discharged before its capacity significantly decreases. How long does a battery storage system last?

For example, a battery with 1 MW of power capacity and 4 MWh of usable energy capacity will have a storage duration of four hours. Cycle life/lifetime is the amount of time or cycles a battery storage system can provide regular charging and discharging before failure or significant degradation.

What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed.

How long do solar batteries last?

That said, some premium models can keep going for up to 15 years or even longer with the right care and maintenance. With batteries compatible with or without solar panels, you can expect the same sort of lifespan with solar battery storage too.

What is storage duration?

Storage duration is the amount of time storage can discharge at its power capacity before depleting its energy capacity. For example, a battery with 1 MW of power capacity and 4 MWh of usable energy capacity will have a storage duration of four hours.

How many cycles a day should a battery storage system run?

A quality battery storage system should be able to manage 6,000 to 10,000

cycles before you start to see a dip in its capacity. At one cycle a day, that's roughly 15 years plus. It's worth noting that the frequency of cycles you get through varies depending on the energy consumption patterns of your home.

How does solar battery storage work?

To comprehend how does solar battery storage work even further, let's consider a scenario in which surplus midday production charges the batteries to capacity. Subsequently, at night or during a grid outage, the stored energy is released through the inverter to power circuits.
