

Inverter grid-connected dualloop control

Overview

Abstract: Grid connected inverter can attenuate high frequency harmonics effectively through an LCL filter which has potential benefits for the inverter to get higher harmonic performance with lower switching frequency and less inductance in contrast with L filter. However, LCL filter is a third order system without damping and easy to resonate. In order to eliminate resonance and improve system stability, dual-loop control strategy with grid current feedback and capacitor current feedback was proposed in this paper, where inner capacitor current regulation is adopted for active damping. System modeling and stability analysis were presented. The simulation and experiment results proved that the dual-loop current control strategy for grid-connected inverter with LCL filter is feasible, the resonance of grid current is avoided and high ingrid power factor is achieved.

Inverter grid-connected dual-loop control

Dual-loop grid current control technique for grid-connected inverter

Download Citation , Dual-loop grid current control technique for grid-connected inverter using an LCL filter , Grid connected inverter can attenuate high frequency harmonics ...
