

Lithium battery discharge 50a with inverter

Overview

How to set a discharge AMP on an inverter?

Discharge Amps: Set according to Inverter size and battery capacity. 3. Shut Down The recommended shutdown % is 20% as it will prolong the battery life and deliver optimal performance. Check the rating of the inverter and the battery pack that will be working together. Make sure that the correct gauge cable is used and the correct fuse protection.

How do I set the charge/discharge current for the batteries?

You set the charge/discharge current for the batteries on the inverter in the battery setup page of the settings menu. The Sunsynk 5.12/5.32kWh batteries have a capacity of about 100Ah and a 50A continuous charge/discharge current so you can set the capacity charge and discharge using these values.

What is the maximum charge/discharge current for an inverter?

The inverter specifications say the maximum charge/discharge current is 50A and recommends 16-25mm2 battery cables and a 200A DC circuit breaker. This seems high so I'm a bit confused. My understanding is to select the DC breaker, I would use the formula $1.25 \times 50 \text{ A} = 62.5 \text{ A}$ and choose the next highest rated breaker size, which is 70 A.

What if the battery power rating is lower than the inverter?

If the power rating of the battery is lower than the inverter, then make sure the maximum discharge current is set to conform to the battery power rating. Set the maximum discharge current to 100A in the battery settings. For batteries connected in parallel, please see the best practices guide.

What is the maximum charge/discharge of a battery?

Two 5.12/5.32kWh batteries have a continuous discharge of 100A. This means that the maximum charge/discharge is limited to the 90A of the inverter. Other Current Limiting Factors Your current should also be suitable for the

rated current of your battery cables.

How many kWh can a battery charge at 50 volts?

One battery charging or discharging at 50A will discharge at $58.4V \times 50A = 2.92kWh$. The charge and discharge current in the inverter settings is the total charge and discharge current of all of the batteries connected so 2 batteries would be able to charge or discharge at 100A, 3 batteries at 150A, etc.

Lithium battery discharge 50a with inverter

What Are Battery Discharge Rates and Why Should You Care?

Learn what battery discharge rates mean, how they affect lithium performance, and how to manage them for longer life in off-grid or 12V systems.
