

Multiple energy storage systems

Overview

What is a multi-storage integrated energy system?

To address the insufficient flexibility of multi-energy coupling in the integrated energy system and the overall strategic demand of low-carbon development, a multi-storage integrated energy system architecture that includes electric storage, heat storage and hydrogen storage is established.

Why is multi-energy storage important?

Multi-energy storage system employing different types of ESS helps to meet the complementary coordination between different types of energy storage, which is important in improving system flexibility, reliability and economy. Because of these advantages, the researches on hybrid energy storages of electricity and heat in RIES gradually rose.

How a multi-energy storage system improves wind power consumption?

The configuration of multi-energy storage system improves the ability of wind power to be consumed. By storing excess power from wind turbine, the utilization rate of wind power can reach 91.3%. The stored power is released during the peak demand, which reduces the power purchase of the grid.

Does integration of multi-energy storage systems reduce the operating cost of Ries?

The integration of multi-energy storage systems utilizes the time-of-use tariff for price arbitrage and reduces the operating cost of RIES. Fig. 9 displays the wind power dispatch and wind curtailment under the original strategy S0 and the strategy S3 of multi-energy storage system.

What is a two-stage optimization model of multi-energy storage configuration?

A two-stage optimization model of multi-energy storage configuration is developed. The sites and capacities of hybrid energy storages in power and thermal networks are optimized. Three methods to determine the installation

locations are compared. The economics performances at different configuration strategies are compared.

What is a multi-energy storage optimal configuration model?

5. Conclusions A multi-energy storage optimal configuration model considering PDN and DHN were established to optimize the installation position and capacity of EES and TES to minimize the comprehensive cost of RIES. Three methods were compared by computation efficiency and optimum results.
