

Nepal user-side frequency regulation energy storage project

Overview

Is energy storage a new regulatory resource?

As a new type of flexible regulatory resource with a bidirectional regulation function [3, 4], energy storage (ES) has attracted more attention in participation in automatic generation control (AGC). It also has become essential to the future frequency regulation auxiliary service market.

Does Nepal still have electricity?

Despite strong policies and delivery achievements, around 25% of Nepal's population still does not have access to electricity. Furthermore, over 3 million households still cook using traditional cook stoves that have adverse health impacts especially on women and children. The RE sector faces numerous challenges.

Do energy storage stations improve frequency stability?

With the rapid expansion of new energy, there is an urgent need to enhance the frequency stability of the power system. The energy storage (ES) stations make it possible effectively. However, the frequency regulation (FR) demand distribution ignores the influence caused by various resources with different characteristics in traditional strategies.

What is the framework of frequency regulation power optimization?

The framework of frequency regulation power optimization comprises a power rolling distribution module and an efficiency evaluation module, as shown in Fig. 1. Fig. 1. FR power optimization framework. The power rolling distribution module runs per AGC command period, including the following two steps.

Nepal user-side frequency regulation energy storage project

"Energy Storage: Nepalese Perspective".

Hydropower units can quickly regulate their generation and are most suitable to offer this storage service. They can offer daily, weekly or seasonal storage service.
