The problem is that an electric motor can draw very large startup current - it can be as 10-20 times the nominal for a couple of seconds.

What is the difference between a battery and a power supply?

A battery is able to supply that current, while a typical power supply with overcurrent protection may latch or enter hiccup mode, from which it can't escape. First of all you need to determine the nominal motor current and the maximum current. The maximum current flows when the motor is mechanically overloaded.

What SMPS power supply do I Need?

Put a SMPS (switch mode power supply) that can withstand the maximum motor current - it will be expensive. The power supply must be enclosed this way so no water can reach it. Put a SMPS that is designed to work with a battery and also put a battery smaller than original.
