

# Output value of grid-side energy storage projects

#### **Overview**

PHS systems pump water from a low to high reservoir, and release it through a turbine using gravity to convert potential energy to electricity when needed17,18, with long lifetimes (50-60 years)17.

How long does a grid need to store electricity?

First, our results suggest to industry and grid planners that the cost-effective duration for storage is closely tied to the grid's generation mix. Solar-dominant grids tend to need 6-to-8-h storage while wind-dominant grids have a greater need for 10-to-20-h storage.

How can energy storage help a vertically integrated utility?

Energy storage can be used by a vertically integrated utility to reduce operational costs and avoid or defer investment in generation, transmission, and distribution. Energy storage can participate in wholesale energy, ancillary, and capacity markets to generate revenue for storage owners.

Do investors underestimate the value of energy storage?

While energy storage is already being deployed to support grids across major power markets, new McKinsey analysis suggests investors often underestimate the value of energy storage in their business cases.

What is the economic value of energy storage?

One study found that the economic value of energy storage in the U.S. is \$228B over a 10 year period. 27 Lithium-ion batteries are one of the fastest-growing energy storage technologies 30 due to their high energy density, high power, near 100% efficiency, and low self-discharge 31. The U.S. has 1.1 Mt of lithium reserves, 4% of global reserves. 32.

Does grid energy storage have a supply chain resilience?

This report provides an overview of the supply chain resilience associated with several grid energy storage technologies. It provides a map of each technology's supply chain, from the extraction of raw materials to the

production of batteries or other storage systems, and discussion of each supply chain step.

How does long-duration energy storage affect marginal electricity prices?

The total (a), regional (b), hourly (c), and monthly (d) distributions in the mean marginal electricity prices as the amount of mandated long-duration energy storage (in TWh) increases. Increases up to 20 TWh significantly decrease the variability in marginal prices while increases beyond 20 TWh have a lesser effect.
