

Photovoltaic frequency modulation energy storage equipment

Overview

Is a frequency modulation control strategy suitable for PV-energy storage systems?

In response to the shortcomings of the classic VSG control strategy mentioned above, this paper proposes a frequency modulation control strategy with additional system active power constraints for PV-energy storage systems (hereinafter referred to as active power constraint control strategy).

What is a frequency modulation control strategy for VSG systems?

A frequency modulation control strategy for VSG systems with additional active power constraints is proposed by overlaying the active power changes of photovoltaic and energy storage systems through appropriate functional relationships into the control loop of synchronous generators.

Can VSG control improve frequency response characteristics of photovoltaic and energy storage systems?

This work was supported by the New Power System Major Science and Technology Research Project of State Grid Hebei Electric Power Company Ltd. (kj2022-058) (Research on control strategy for improving the frequency response characteristics of photovoltaic and energy storage systems based on VSG control).

Can a frequency modulation control strategy improve the frequency active support capability?

In Section 4, simulations were conducted using Matlab/Simulink and RT-LAB to verify that the frequency modulation control strategy with additional active power constraints in the VSG system can accelerate the frequency modulation speed and improve the frequency active support capability under different load conditions.

How fast is frequency active support for PV-energy storage VSG system?

On average, the frequency fluctuation is suppressed by about 0.15 Hz compared to typical VSG control, and the average adjustment time is also about 2 s faster. Table 3. Response time of frequency active support capability for PV-energy storage VSG system. 5. Conclusions.

Can a frequency modulation generator achieve rapid response?

When using this strategy, comparing the slope of change, it can be seen that the frequency modulation generator has achieved rapid response compared to when no active power constraint control strategy is used, and can achieve frequency modulation under the premise of rapidly increasing active power, making the system recover to stability faster.
