

Rotor speed control of flywheel energy storage

Overview

Compared with other ways to store electricity, FES systems have long lifetimes (lasting decades with little or no maintenance; full-cycle lifetimes quoted for flywheels range from in excess of 10, up to 10, cycles of use), high ($100-130~W\cdot h/kg$, or 360-500~kJ/kg), and large maximum power output. The (ratio of energy out per energy in) of flywheels, also known as round-trip efficiency, can be as high as 90%. Typical capacities range from 3 to 1.

Flywheels can store energy kinetically in a high speed rotor and charge and discharge using an electrical motor/generator. Wheel speed is determined by simultaneously solving the bus regulation and torque equations.

Rotor speed control of flywheel energy storage

How flywheel energy storage works

How Flywheel Energy Storage Systems Work. Flywheel energy storage systems (FESS) employ kinetic energy stored in a rotating mass with very low frictional losses. Electric energy input ...

Compared with other ways to store electricity,

FES systems have long lifetimes (lasting decades with little or no maintenance; full-cycle lifetimes quoted for flywheels range from in excess of 10, up to 10, cycles of use), high specific energy (100-130 W·h/kg, or 360-500 kJ/kg), and large maximum power output. The energy efficiency (ratio of energy out per energy in) of flywheels, also known as round-trip efficiency, can be as high as 90%. Typical capacities range from 3 kWh to 1...
