

Solar DC system composition

Overview

The majority of solar modules available on the market and used for residential and commercial solar systems are silicon-crystalline. These modules consist of multiple strings of solar cells, wired in series (positive to negative), and are mounted in an aluminum frame.

Solar photovoltaic (PV) energy systems are made up of diferent components. Each component has a specific role. The type of component in the.

A charge controller regulates the amount of charge going into the battery from the module to keep from overcharging the battery. Charge controllers can vary in the amount of amperage they can regulate. Some models will include additional features such as.

A direct current (DC) disconnect switch is installed between the inverter load and the solar array. The disconnect switch is used to safely de-energize the array and isolate the inverter from the.

Safety disconnect switch are required by the National Electric Code (NEC) on the AC-side of the inverter to safely disconnect and isolate the inverter from the AC circuit. This is for troubleshooting and performing maintenance on the system. For grid-connected systems.
