

# Solar energy and energy storage connection

#### **Overview**

"Storage" refers to technologies that can capture electricity, store it as another form of energy (chemical, thermal, mechanical), and then release it for use when it is needed. Lithium-ion batteries one such technology. Although using energy storage is never 100% efficient—some energy is always lost in converting.

Pumped-storage hydropoweris an energy storage technology based on water. Electrical energy is used to pump water uphill into a reservoir when energy demand is low. Later.

The most common type of energy storage in the power grid is pumped hydropower. But the storage technologies most frequently coupled with solar power plants are electrochemical storage (batteries) with PV plants and thermal storage (fluids) with CSP plants.

Many of us are familiar with electrochemical batteries, like those found in laptops and mobile phones. When electricity is fed into a battery, it causes a chemical reaction, and energy is stored. When a battery is discharged, that chemical reaction is.
