

Southern European photovoltaic energy storage power supply prices

Overview

Why are European wholesale electricity prices so low?

European wholesale electricity markets have seen zero or negative power prices for the most hours on record this year amid soaring renewable energy generation and a mismatch between supply and demand hours for solar power.

Is Germany still a leader in photovoltaics & residential storage systems?

In a country-by-country comparison, Germany is still the European leader for both photovoltaics and residential storage systems. Installation figures for 2020 indicate that the German market accounts for around 70% of the total installed capacity in the European residential storage system market, making it a force that cannot be overlooked.

Why are power prices so low in Europe?

Wholesale power markets in most of Europe's key economies turned out zero or negative prices for a record number of hours in the first five months of this year at times of low demand. That means producers more frequently have to pay to offload power, or stop their plants.

Why are photovoltaic systems growing?

The growing installed capacity of photovoltaic installations is considered one important driving factor behind this trend. Systems ranging from 10 to 15 kW as well as from 15 to 20 kW in particular have seen a steep increase since the EEG amendment in early 2021, with the number of installed storage systems growing in parallel.
