

Standard layout of solar panels

Overview

The Renewable Energy Ready Home (RERH) specifications were developed by the U.S. Environmental Protection Agency (EPA) to assist builders in designing and constructing homes equipped with a set of features that make the installation of solar energy systems after the completion of the home's construction.

These specifications were created with certain assumptions about the house and the proposed solar energy system. They are designed for builders.

EPA has developed the following RERH specification as an educational resource for interested builders. EPA does not conduct third-party verification of the.

Builders should use EPA's online RERH SSAT to demonstrate that each proposed system site location meets a minimum solar resource potential. EPA has.

The builder should install a 1" metal conduit from the designated inverter location to the main service panel where the system is intended to be tied into the home's.

There are two ways of arranging solar modules in photovoltaic power stations, horizontal and vertical. Horizontal means that the long side of the solar module is parallel to the east-west direction, while vertical means that the short side is parallel to the east-west direction.
