

The function of 48V power supply for communication base station

Overview

The use of -48V power supply can provide semiconductor devices with a more stable and cleaner power supply by using techniques such as the voltage regulator circuit and filter circuit so that it improves the performance and reliability of the equipment. What is a -48V power supply system?

Products basically use -48V power supply system, and the actual measured voltage is generally -53.5V. This is because for reliability reasons, communication equipment is equipped with a backup battery (-48V). In order to ensure reliable charging of the battery, the supply voltage needs to be slightly higher than the battery voltage.

What is the operating voltage range for -48V system equipment?

For -48V system equipment, the required operating voltage range is -38.4V \sim 57.6V, but in fact we generally require the operating range -36V \sim -72V. The main consideration is that -48V system equipment must be compatible with -60V power supply system, which requires -48 \sim -72V.

Why is a -48 V DC a positive ground system?

The short story is that -48 V DC, also known as a positive-ground system, was selected because it provides enough power to support a telecom signal but is safer for the human body while doing telecom activities.

What is the output voltage of a power supply?

Generally, the output voltage of the power supply is measured to be 26.8V. Generally, the equipment is required to work normally within the voltage fluctuation range of $\pm 20\%$. For -48V system equipment, the required operating voltage range is -38.4V \sim 57.6V, but in fact we generally require the operating range -36V \sim -72V.

What is a -48 volt DC power system?

Telecommunication networks consist of central offices or exchanges where

switching and routing equipment is housed. -48 volt DC power systems offer excellent power efficiency, especially in large-scale deployments. DC power distribution is more efficient compared to AC power due to reduced energy losses during conversion and transmission.

What power supply is used in a central office communication system?

Later, in order to be compatible with early equipment and reduce costs, the central office communication equipment still used -48V power supply. Likewise, with a negative power system, the positive ground is just a convention. It turns out that there is a saying that there are a lot of negative charges in the air.

The function of 48V power supply for communication base station

Why is the power supply voltage of the communication base ...

In addition to providing power supply to the base station equipment after the mains power failure, the UPS power supply of communication base stations can also solve grid ...

WhatsApp Chat

Why is the power supply voltage of the communication base station -48V

In addition to providing power supply to the base station equipment after the mains power failure, the UPS power supply of communication base stations can also solve grid ...

WhatsApp Chat

Why does the communication base station use -48V ...

The voltage of +48V and -48V is equal, but the current flow is not the same. +48V flow to 0V, V0 flow to -48V. So -48V voltage is the ...
