

# The larger the wattage of the photovoltaic panel the smaller the size

### **Overview**

Why do solar panels have a higher wattage?

As the wattage of a solar panel increases, so too does its physical size. This is because higher-wattage panels contain more photovoltaic cells to generate more electricity. The data showcases this trend, with lengths exceeding 82.7 inches becoming more common for higher-wattage models.

Are all solar panels the same size?

If solar panels contain different numbers of solar cells, then they aren't all the same size. As a general rule, the more solar cells a solar panel has, the bigger the size. Sixty-cell panels are usually smaller than seventy-two-cell solar panels. But things get a bit more complicated when we look at the efficiency of solar cells.

What determines a solar panel wattage?

The quantity of DC (direct current) power each solar panel can generate under typical test conditions determines its rating, including the wattage of solar panels. The power generated by a solar panel is measured in watts (W), which correspond to the panel's optimum sunshine and temperature conditions.

What determines the size of a solar system?

The number of solar panels multiplied by their output determines the size of the solar system. For example, if you have 20 solar panels with a wattage of 330W each, it results in a 6,600 W or 6.6kW solar system. The wattage of the solar panels, in this case, is crucial in determining the overall capacity of the system.

How do solar panel wattages work?

Strung together and wired into your home's electrical system, solar panel wattages are added together to calculate your total solar capacity. So if you install 20 solar panels, each rated at 325W, your total solar panel wattage

would be 6,500W or 6.5 kW.

How big are solar panels?

This is the typical classification of solar panel sizes (based on the solar cell size). It's a bit theoretical and quite useless for most calculations. The only useful thing that we get from this is depth or height (panel thickness): Most solar panels are about 1.5 inches thick.
