

# Three types of protection for grid-connected inverters

#### **Overview**

Can PV inverters provide grid voltage support 24/7?

PV inverters can also be configured to provide grid voltage support 24/7 by providing reactive current at night. This function uses a small DC power supply to energize the inverter DC bus from the AC grid connection. Once energized, the IGBTs can be commanded to provide reactive current at night.

What is grid tie inverter overvoltage protection?

1. Input overvoltage protection: When the DC-side input voltage is higher than the maximum allowable DC array access voltage of the grid tie inverter, the inverter is not allowed to start or stop within 0.1s (in operation) and a warning signal is released at the same time.

What happens when the grid-tie inverter stops supplying power to the grid?

Automatic recovery of the grid-connected protection: After the grid-tied inverter stops supplying power to the grid because of the fault of the grid, the grid-tie inverter should be able to automatically send power to the grid 5 min after the grid voltage and frequency return to the normal range for 20s.

How can a grid be protected from overcurrent faults?

Another option is to eliminate overcurrent protection schemes and develop more advanced protection schemes that use current differential or other methods to detect and clear faults. An additional protection scheme used on the grid is based on special relays that measure the rate of change of frequency (ROCOF).

What are inverter grid support functions?

Inverter grid supporting functions along with voltage and frequency ride through, provide key behaviors that both support and enhance grid reliability. Today's PV and energy storage inverters can be deployed individually and in a mixed design affording plant designers' options for energy capture and grid

How to choose a grid-tied inverter?

Over-temperature protection: The grid-tied inverter should have over-temperature protection functions, such as too high inner ambient temperature alarm (such as the too high temperature in the case caused by fire), too high temperature of the key components in the machine (such as IGBT, Mosfet and so on). 11.
