

# What is the Electric Energy Storage Project

#### **Overview**

What is an energy storage system?

An energy storage system (ESS) for electricity generation uses electricity (or some other energy source, such as solar-thermal energy) to charge an energy storage system or device, which is discharged to supply (generate) electricity when needed at desired levels and quality. ESSs provide a variety of services to support electric power grids.

What is electrical energy storage (EES)?

Electrical Energy Storage (EES) refers to systems that store electricity in a form that can be converted back into electrical energy when needed. 1 Batteries are one of the most common forms of electrical energy storage.

What are energy storage solutions for electricity generation?

Energy storage solutions for electricity generation include pumped-hydro storage, batteries, flywheels, compressed-air energy storage, hydrogen storage and thermal energy storage components. The ability to store energy can facilitate the integration of clean energy and renewable energy into power grids and real-world, everyday use.

How does energy storage function?

During off-peak periods at night, potential energy is stored by pumping water from the lower to the upper reservoir. During peak hours at daytime, the water is released back to the lower reservoir, thus generating electrical power. Compressed air energy storage (CAES) Systems: these systems use compressed air as the energy storage medium.

Is electric energy storage a new technology?

Electric energy storage is not new. As far back as 1786, Italian physicists discovered the existence of bioelectricity. In 1799, Italian scientist Alessandro Giuseppe Antonio Anastasio Volta invented modern batteries. In 1836,

batteries were used in communication networks.

What types of energy storage systems support electric grids?

Electrical energy storage systems (ESS) commonly support electric grids. Types of energy storage systems include: Pumped hydro storage, also known as pumped-storage hydropower, can be compared to a giant battery consisting of two water reservoirs of differing elevations.
