

Why does the communication base station inverter use 48V

Overview

What is a -48V power supply system?

Products basically use -48V power supply system, and the actual measured voltage is generally -53.5V. This is because for reliability reasons, communication equipment is equipped with a backup battery (-48V). In order to ensure reliable charging of the battery, the supply voltage needs to be slightly higher than the battery voltage.

What are the advantages of a negative 48V DC source?

An advantage of negative 48V is that four 12V batteries connected in series create 48V DC usable as a backup power source. Central telecom stations are known to have elaborate arrays of 48V battery banks. One important aspect of telecom power installations is that the polarity of the 48V DC source is setup to be negative with respect to ground.

Why is 48 a good system voltage?

Back in the day, when Telephony equipment was being developed, 48 was the chosen system voltage because it's considered safe "low voltage", and reduced amperage requirement of equipment powered at this voltage.

Is -48V backwards compatible?

Although many new telecom stations have become very compact, they remain backwards compatible in terms of being powered by -48V. This feature will remain a standard into the foreseeable future. There are installations where power demand is modest and there is no room to accommodate 4 batteries to provide 48V emergency power.

What is a -48 volt DC power system?

Telecommunication networks consist of central offices or exchanges where switching and routing equipment is housed. -48 volt DC power systems offer excellent power efficiency, especially in large-scale deployments. DC power

distribution is more efficient compared to AC power due to reduced energy losses during conversion and transmission.

Why is 48V DC polarity important?

One important aspect of telecom power installations is that the polarity of the 48V DC source is setup to be negative with respect to ground. This convention makes the entire telecom system more immune to corrosion and safer for individuals performing telecom maintenance.

Why does the communication base station inverter use 48V

"Negative" 48 Volt Power: What, Why and How

Back in the day, when Telephony equipment was being developed, 48 was the chosen system voltage because it's considered safe "low voltage", and ...
