

Wind power system production

Overview

In 2020, wind supplied almost 1600 of electricity, which was over 5% of worldwide electrical generation and about 2% of energy consumption. With over 100 added during 2020, mostly, global installed wind power capacity reached more than 730 GW. But to help meet the 's goals to, analysts say it should expand much faster – by over 1%.

Wind turbines use blades to collect the wind's kinetic energy. Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn. The blades are connected to a drive shaft that turns an electric generator, which produces (generates) electricity.

Wind power system production

Modeling and control design of hydrogen production process for ...

As a good candidate, the advancing wind power technologies have increased the use of wind energy conversion system (WECS) for distributed generation (from wind farms) to ...
